

Unstable flow-normal tangent ribbon on the Rössler attractor

- long trajectory ($t = 1000$)
- transported unit flow-normal ribbon ($t = 30$)
- y -minimum half-nullcline: $\dot{y} = 0, y \leq 0$

State burn-in: 200; tangent relaxation: 80; $\Delta t_{\text{ribbon}} = 0.0025$
Accepted-step gauge: $\|v\| = 1$ and $v \cdot f = 0$
